What is oral surgery?

Oral surgery is a sub-specialty of dentistry that deals with diagnosing, treating, and managing oral and maxillofacial problems. These include tooth extractions, dental implant placements, facial trauma, jaw surgery, and other complex dental issues. If you face any of these dental problems, an oral surgeon in Katy, Texas, can help you regain your oral health and function.

Who performs oral surgery?

An oral surgeon is a dental expert who performs surgical procedures on the mouth and jaw. Oral surgeons receive extensive training in dental surgery and anesthesia. They can perform various procedures to correct dental problems, relieve pain, and improve oral health.

Oral surgeons: education and training

To become an oral surgeon in Katy, Texas, an individual must complete a rigorous educational and training process. This process typically involves obtaining a Bachelor's degree from an accredited college or university. It is followed by four years of dental school to get a Doctor of Dental Medicine or Doctor of Dental Surgery (DDS) degree.

After completing dental school, aspiring oral surgeons must complete a specialized oral and maxillofacial surgery residency program. These programs typically last four to six years and provide extensive training in surgical procedures of the mouth, teeth, and jaw. Residents gain hands-on experience in surgical procedures, anesthesia administration, and patient care during this time.

In addition to formal education and training, oral surgeons must obtain state licensure to practice in Katy, Texas. This process involves passing written and clinical exams to demonstrate proficiency in oral surgery.

Continued education is also essential for oral surgeons to stay up-to-date with the latest advancements in their field. Many oral surgeons participate in continuing education programs, attend conferences, and conduct research to improve their knowledge and skills.

Overall, becoming an oral surgeon in Katy, Texas, requires a significant amount of dedication, education, and training. As a result, patients can trust that their oral surgeon has the expertise and qualifications necessary to provide safe and effective surgical care.

Oral surgeons: procedures they perform

An oral surgeon in Katy, Texas, can perform many procedures to treat complex dental problems. These include:

- **Wisdom Teeth Removal**

Wisdom teeth, also known as third molars, typically emerge in the late teenage years or early twenties. Wisdom teeth can often cause pain, infection, and other dental problems. An oral surgeon can safely and effectively remove these teeth to relieve discomfort and prevent further issues.

- **Dental Implants**

Dental implants are an excellent option for patients missing one or more teeth. The implant is a titanium post surgically placed into the jawbone, fusing with the bone over time. The implant can then be topped with a dental crown or bridge to restore the missing tooth.

- **Jaw Surgery**

Oral surgeons can also perform corrective jaw surgery to correct misaligned jaws, improve bite function, and alleviate pain. The doctor may recommend this surgery for patients with the severe bite or jaw-alignment issues.

- **Biopsies**

Oral surgeons can perform biopsies to test for oral cancer or other types of abnormal tissue growth in the mouth. Suppose a biopsy reveals cancerous or precancerous cells. In that case, the oral surgeon can work with other healthcare professionals to develop an appropriate treatment plan.

How to find the best oral surgeon in Katy, Texas

Finding the right oral surgeon in Katy, Texas, can be daunting, especially when dealing with a dental emergency. Fortunately, Zocdoc makes finding qualified professionals who can provide the care you need easy. Zocdoc provides an online platform that connects patients with highly qualified oral surgeons in their area. With Zocdoc, you can access a vast network of professionals who provide first-class care.

To find the best oral surgeon in Katy, Texas, simply sign up for a free Zocdoc account and enter your desired date, time, location, insurance company, and specialty. If you need more clarification about your insurance information, Zocdoc's Insurance Detector can help you. Zocdoc provides a long list of doctors matching your search criteria. You can narrow your search using advanced parameters such as gender, hospital affiliation, spoken language, and patient care options.

Once you find a potential oral surgeon, you can view their professional biography on their profile page. Their brief bio, teaching experience, areas of expertise, location, board accreditations, and other details are on their profile page. You can also read authenticated patient reviews to gain insights into the surgeon's skills, bedside manner, and overall patient experience.

Zocdoc can arrange both face-to-face and video appointments. You can filter your options by looking for the purple video icon in the specialist's profile. This feature allows you to access care from your home without traveling to the surgeon's office.

Once you find the right oral surgeon, you can make an appointment in real time and verify your insurance on the spot. With Zocdoc, you can rest assured that you are in good hands and receiving the highest quality care from qualified professionals. Booking an appointment with Zocdoc is easy, safe, and free.

Statistics on oral health in Texas

According to Texas Health and Human Services, about 53 percent of kindergarteners and 67 percent of third-graders in Texas have experienced tooth decay. In Texas and the U.S., about 11.6 percent of children reported having tooth decay or cavities, and about 88.4 percent of children reported no tooth decay or cavities. Around 53% of kindergarten children in Texas had experienced tooth decay, meaning they either had a filling, a crown, an untreated cavity, or a decayed tooth removed due to decay.

Additionally, around 19.7 percent had untreated tooth decay. Furthermore, approximately 15.1 percent of children had never been to a dentist. In 2019, the American Dental Association reported that Texas had a dentist-to-population ratio of 1,550:1. This ratio is lower than the national average of 1,760:1.

The Texas Department of State Health Services reported that nearly 61% of adults aged 18–64 visited a dentist in 2018, while about 76% of children aged 6–9 had a dental visit in Texas. Moreover, fluoridation involves adding fluoride to public water supplies to prevent tooth decay. About 79% of Texans had access to fluoridated water in 2018, according to the Centers for Disease Control and Prevention (CDC).
